

FlexType – flexible feeding systems by RNA!

FlexType B I 630er Cylinder pot with exchangeable format sets

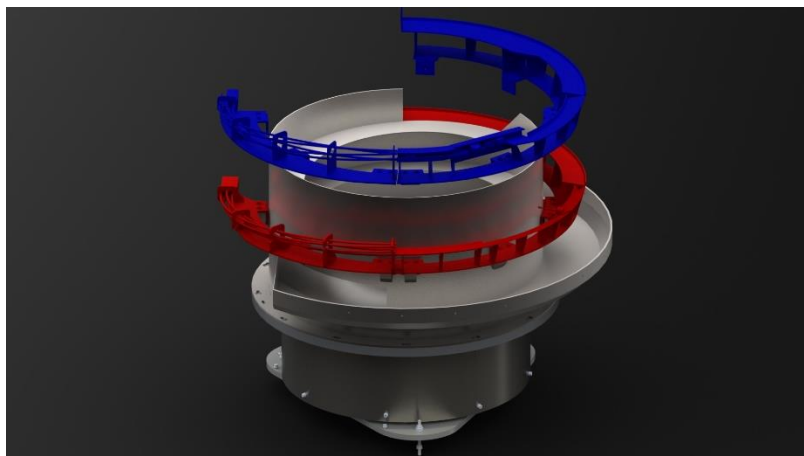

- very high flexibility
- variable, adjustable sorting for a wide range of parts
- short changeover times
- fast delivery times
- filling via return pockets possible
- easy to clean

The basis is a specially manufactured 630 cylindrical pot. This is equipped with holders which are attached in certain welding jigs. The different format sets required for the desired sorting are then attached to these holders. The dimensions of the pots always remain the same. In addition, threads are provided on the outer ring of the return pockets in order to attach all possible walls, funnels or other sorting elements. Filling into the return pocket is also possible. Due to the generous dimensions of the pot and the possibility of return, sorting of a large number of workpieces is possible.

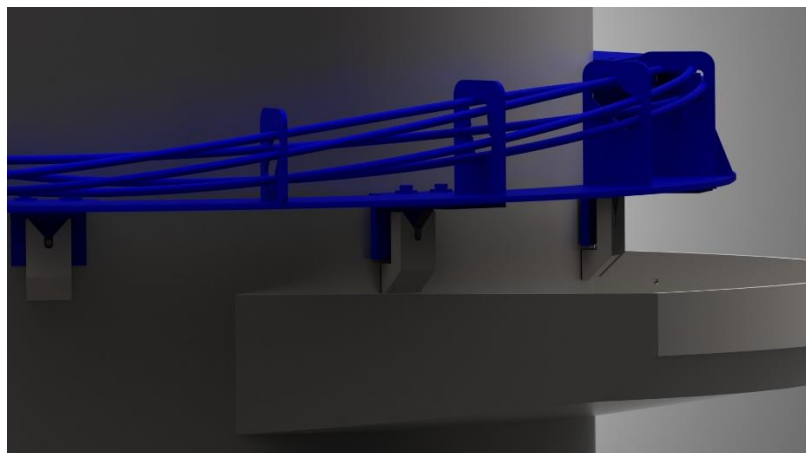

General features:

The aim was to develop a sorting pot in which the most varied geometries of workpieces can be fed with the least possible effort during retooling. With our new **FlexType B** product series this is now possible.

Particularly noteworthy is the great flexibility that these pots offer. Thanks to a quick-change system for the format sets, it is possible to change between different part geometries in an extremely short time and thus sort a wide range of parts in just one pot. The dimensions of all 630 pots are identical. The individual format sets can be ordered individually depending on the requirements and geometry of the part. And last but not least, these pots are also very easy to clean.

Different format sets for the 630 cylinder pot

Changeable format set
